

## Introduction

New human, animal, and plant pathogens can emerge any time without warning and may start spreading widely before they are detected, making their containment challenging or impossible. The continued exponential surge of complete genome assemblies of pathogens is being assisted by the increase in accuracy, throughput, and accessibility to sequencing tools and technologies. However, this surge is also creating pressure on many bioinformatic processes, such as taxonomic assignment, which are done mostly in curation processes to this day. This curative process not only increases the time needed to obtain information from the genomes but also reduces our ability to focus on fine grained details, such as information on groups within species or outbreaks. We present genomeRiv as a web service, backed by a database and pipeline, that identifies and assigns taxonomies to genomes from the genus rank towards the strain level.

## Methods Life Identification Numbers (LINs)

- LINs represent precisely how similar genomes are to each other
- The current LINs uses ANI as measure of genome similarity
- LINs are indices that automatically organize genomes in a database based on reciprocal similarity (expanding hierarchical taxonomy from the species to almost the individual).
- LINs and LINGroups precisely circumscribe within-species groups of genomes.
- Conceptually, LINs can be expanded to cover higher and lower similarities.

%ANI Similarity		Genus → Species												within Species												Similarity		Closest																																																																																											
		70						75						80						85										90						95						96						97						98						98.5						99						99.25						99.5						99.75						99.9						99.925						99.95						99.975						99.99

## Discussion

- LINs assigned to individual *Ralstonia solanacearum* species complex (RSSC) genomes in genomeRiv reflect the precise genome similarity among genomes
- LINs reflect core genome phylogenetic relationships
- LINs assigned to genomes are used to circumscribe groups of genome (LINGroups) that correspond to species, phylotypes, and population clusters.
- LINGroups are annotated in genomeRiv
- Genomes of putative RSSC genomes can be precisely identified as members of the circumscribed LINGroups
- While LINGroup circumscriptions may get updated stability is provided by the LINs assigned to the individual genomes that remain the same.

## Data

- 50,000 bacterial species circumscribed on genomeRiv using LINs
- 310,000 bacterial genomes assigned LINs
- 5.8 million metadata entries linked to genomes
- Archaea species integration in progress
- Fungal and Viral genome LIN assignment underway

Sharma, P., Johnson, M. A., Mazloom, R., Allen, C., Heath, L. S., Lowe-Power, T. M., & Vinatzer, B. A. (2022). Meta-analysis of the *Ralstonia solanacearum* species complex (RSSC) based on comparative evolutionary genomics and reverse ecology. *Microbial Genomics*, 8(3).

## Conclusion

We expect the high resolution, speed, ease of use, and online availability of genomeRiv to facilitate genome-based identification for applications in environmental microbiology, biosecurity, and disease surveillance.

## Results in GenomeRiv.cs.vt.edu

**genomeRiv** is a publicly accessible website designed to cluster and identify prokaryotic genomes using their nucleotide sequence or their sourmash signatures (when sharing sequence is not ideal).

- Users can not only identify their genomes, but also contribute them to genomeRiv and describe their identified LINGroups, increasing the speed, depth and breadth of future runs
- LINs can be used to serve as a bridge between traditional and phylogenetic taxonomy using genome similarity as a unit
- genomeRiv LINs can be used as a template for similarity-based taxonomy where the similarity criteria could be refined or changed as needed
- Similar to learning models, more users will result in better clustering accuracy as more genomes, signatures, and group descriptions are added
- Encourages and facilitates collaboration between parties working in related organism groups
- Has a command line interface (CLI) called BrookLIN for automation
